Fetch test contributor brief

Brief: Tests for the Fetch Standard are located in the fetch/ directory of web-platform-tests/wpt, and results are available at wpt.fyi/results/fetch. [1] [2]

Source question: Where are the Fetch Standard's tests kept, and where can I see them running against browser engines? Cite the README statements supporting both.

Your notes — personal, not source claims: Personal handoff for my next Fetch test contribution. These are my own proposed actions and working notes, not instructions or verified claims from the source.

Before changing anything, I will record the browser and version, a minimal public example, the outcome I expected and what I actually saw. I will remove cookies, authorization headers, account details and private URLs from anything I share.

1. Reopen this brief and follow its original-source link. Compare the saved retrieval time with the current README. If the evidence changed, ask a new focused question instead of editing the accepted copy.
2. Open the browser-results location from the brief. Write down the engine and platform I inspected. A saved answer is a pointer to evidence, not proof that a bug exists or a test passes.
3. Search the cited test directory for a related case before proposing another test. Keep the candidate filename, my reason for choosing it and any unresolved question in my own draft.
4. Separate reproduction from implementation. First describe a small public fixture and expected behavior; then explain the proposed test and the observation it should distinguish.
5. Read the project's current contribution and review instructions before submitting anything. I have not checked those instructions yet, and this brief does not establish them.
6. Keep a handoff log of what I tried, which evidence I saved and what remains uncertain. After interruption, inspect saved work and continue deliberately rather than repeating accepted research.
7. Preserve the PDF and HTML with their recorded hashes and original citations. Ask for missing guidance instead of guessing. My personal checklist is not a source-backed conclusion.

Reference [1]: Tests for the Fetch Standard can be found in the `fetch/` directory of web-platform-tests/wpt.

Reference [2]: A dashboard showing the tests running against browser engines can be seen at wpt.fyi/results/fetch.
